

1. Food Item Management

The system should be able to manage a list of food items, allowing the user to add, edit, delete, and view food items. The system should also be able to calculate the total cost of all the items in the list.

Functionalities:

Add Food Item: This functionality allows users to add a new food item to the list. The user should be able to enter the name of the item, its price and the quantity.

Edit Food Item: This functionality allows the user to edit an existing food item in the list. The user should be able to select the item to be edited and enter the new details.

Delete Food Item: This functionality allows users to delete an existing food item from the list. The user should be able to select the item to be deleted.

View Food Item: This functionality allows the user to view all food items added. The list should display the name, price and quantity of each item.

Calculate Total Cost: This functionality allows the user to calculate the total cost of all the items in the list. The system should add up the cost of each item and display the total cost to the user.

Save Food Item List: This functionality allows the user to save the food item list to a file. The user should be able to select the filename and the system should save the list to the file.

Load Food Item List: This functionality allows users to load a previously saved list from a file. The user should be able to select the filename and the system should load the list from the file.

The program will display a menu with the following options:

- Add a food item
- Edit a food item
- Delete a food item
- View all food items
- Calculate total cost
- Save food item list
- Load food item list
- Exit
